# Install Conda (if you want to run the examples)

- Why Conda?
  - **Easy to deploy clang/LLVM** for the tutorial (a couple of minutes)
- Alternative method: **build clang/LLVM from source**
  - Not recommended for the tutorial
  - Best approach for production installation

# Steps to Install Conda in Mac

Got <https://www.anaconda.com/> -> Download

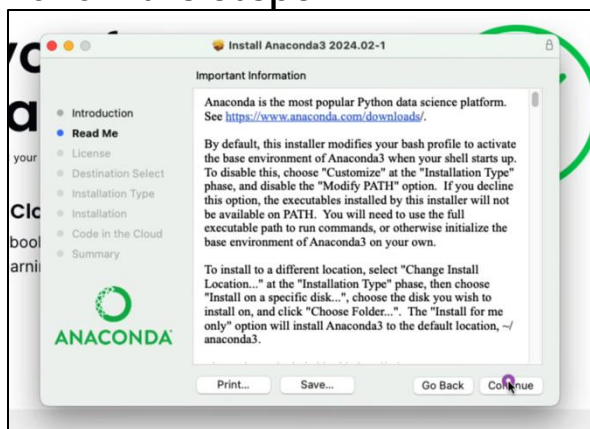

Download

Open Installer

Follow the steps

Provide password if asked

In the terminal, you should see the word **base**:

```
(base) [user@system] $
```

# FPChecker Overview

- Detects floating-point **exceptions**
  - NaN, Infinity
- Shows impacted *lines of code*
- Shows other “**code smells**”
  - Cancellations, underflows
- Analyzes **dynamic range**
  - Is FP32 or FP64 enough?
- Works by **compiler instrumentation**
  - Relies on Clang/LLVM
- Documentation: <https://fpchecker.org/>

# Report Example

The screenshot shows the FPChecker web application. The browser tab is titled "FPChecker Report". The address bar shows the file path: `/Users/lagunaperalt1/projects/fpchecker/FPChecker/tutorial/example_1/fpc-report/index.html`. The page header includes the FPChecker logo and the report title: `Report Title: ./lu_solve bad_matrix.csv`. A link for "Main Report" is visible. The main content area is titled "Main Report" and contains a table of floating-point events.

|                                       | Events              |
|---------------------------------------|---------------------|
| <a href="#">Infinity (+)</a>          | 0                   |
| <a href="#">Infinity (-)</a>          | 0                   |
| <a href="#">NaN</a>                   | <a href="#">824</a> |
| <a href="#">Division by zero</a>      | <a href="#">1</a>   |
| <a href="#">Underflow (subnormal)</a> | 0                   |
| <a href="#">Comparison</a>            | 0                   |
| <a href="#">Cancellation</a>          | 0                   |

A blue arrow points from the [824](#) link in the NaN row to the right-hand screenshot.

The screenshot shows the "Nan Report" page in the FPChecker web application. The browser tab is titled "FPChecker Report". The address bar shows the file path: `/Users/lagunaperalt1/projects/fpchecker/FPChecker/tutorial/example_1/fpc-report/nan/nan.html`. The page header includes the FPChecker logo and the report title: `Report Title: ./lu_solve bad_matrix.csv`. A breadcrumb trail shows [Main Report](#) > [Nan](#). The main content area is titled "Nan Report" and contains a table of files with NaN events.

| File                                                                                              | Lines             |
|---------------------------------------------------------------------------------------------------|-------------------|
| <code>/Users/lagunaperalt1/projects/fpchecker/FPChecker/tutorial/common/blas.cpp</code>           | <a href="#">4</a> |
| <code>/Users/lagunaperalt1/projects/fpchecker/FPChecker/tutorial/common/linear_solvers.cpp</code> | <a href="#">6</a> |

Below the table, there is a section titled "Inputs" with a text box containing the file path: `./lu_solve bad_matrix.csv`.

# Exponent Usage (Dynamic Range)

## Exponent Usage Report

### FP64 Distribution

Out of range for  
FP32

### FP32 Distribution

# LLVM Instrumentation Process

1. Use `clang++-fpchecker` wrapper in your Makefile
  - Or add instrumentation pass to your CFLAGS and/or CXXFLAGS
2. Enable `FPC_INSTRUMENT` environment variable when compiling
  - \$ `FPC_INSTRUMENT=1 make`
3. Run executable
4. Create report

# Two Classes of Env Variables: *Compile-time & Run-time*

✓ Covered in the Tutorial

## Compile-time Variables

| Variable      | Type         | Description                             |
|---------------|--------------|-----------------------------------------|
| FPC_INTRUMENT | Compile-time | Instruments the application             |
| FPC_ANNOTATED | Compile-time | Indicates that the program is annotated |

## Run-time Variables

| Variable                  | Type     | Description                                          |
|---------------------------|----------|------------------------------------------------------|
| FPC_EXPONENT_USAGE        | Run-time | Profiles exponent usage for FP32/FP64                |
| FPC_TRAP_INFINITY_POS     | Run-time | Program exits when Infinity positive is found        |
| FPC_TRAP_INFINITY_NEG     | Run-time | Program exits when Infinity negative is found        |
| FPC_TRAP_NAN              | Run-time | Program exits when NaN is found                      |
| FPC_TRAP_DIVISION_ZERO    | Run-time | Program exits when division-by-zero is found         |
| FPC_TRAP_CANCELLATION     | Run-time | Program exits when cancellation is found             |
| FPC_TRAP_COMPARISON       | Run-time | Program exits when Comparison is found               |
| FPC_TRAP_UNDERFLOW        | Run-time | Program exits when underflow is found                |
| FPC_TRAP_LATENT_INF_POS   | Run-time | Program exits when Latent Infinity positive is found |
| FPC_TRAP_LATENT_INF_NEG   | Run-time | Program exits when Latent Infinity negative is found |
| FPC_TRAP_LATENT_UNDERFLOW | Run-time | Program exits when Latent Underflow is found         |

# Software Requirements

- Linux or Mac OS
  - Windows not supported
- LLVM/Clang 19.1.7
- Cmake
- Python 3.12
- Matplotlib
- Optional for parallel code:
  - MPI
  - OpenMP

# Installation Process

1. Install **Conda** (this allow us to install LLVM easily)
2. Install FPChecker

Slides at: <https://fpanalysistools.org/SC25/>

# How to install Anaconda on Mac or Linux

For Mac, watch this YouTube video:

<https://youtu.be/DNu8pQOYRGg>

For Linux:

<https://docs.conda.io/projects/conda/en/stable/user-guide/install/linux.html>

# Steps to Install Conda in Mac

Got <https://www.anaconda.com/> -> Download

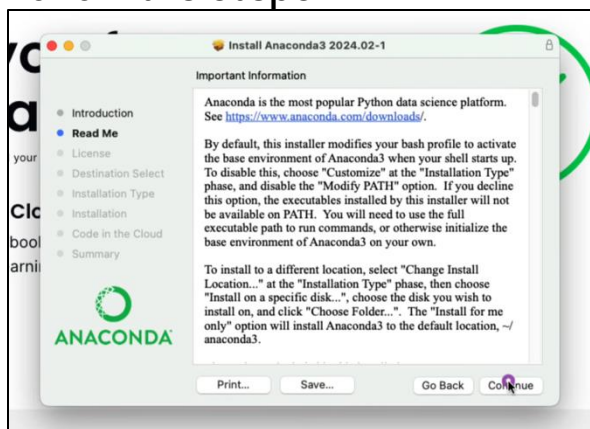

Download

Open Installer

Follow the steps

Provide password if asked

In the terminal, you should see the word **base**:

```
(base) [user@system] $
```

# Docker Container (Optional if Conda doesn't work)

Instructions:

```
git clone https://github.com/keram88/FPChecker
cd FPChecker
(sudo) docker build -t fpchecker .
(sudo) docker run --rm -it -v $(pwd):/workspace -w /workspace fpchecker /bin/bash
cd tutorial
# Continue the workshop instructions from here
```

For help, contact: Mark Baranowski [mark.s.baranowski@gmail.com](mailto:mark.s.baranowski@gmail.com), Ganesh [ganesh@cs.utah.edu](mailto:ganesh@cs.utah.edu)

# Get FPChecker

This tutorial is based on release **v0.5**

```
# We will install all in /tmp
$ cd /tmp
$ mkdir tutorial
$ cd tutorial

# Clone FPChecker
$ git clone https://github.com/LLNL/FPChecker.git
$ cd FPChecker
```

# Install FPChecker Dependencies with Conda (Option 1)

## *Manual Installation*

```
# Create a conda env
$ conda create --name tutorial_env
$ conda activate tutorial_env

# Install dependencies: cmake, LLVM, clang++, python
$ conda install cmake
$ conda install llvmdev=19.1.7 -c conda-forge
$ conda install clangxx=19.1.7 -c conda-forge
$ conda install python=3.12.9

# Install matplotlib. Not required to build FPChecker, but needed for reports
$ pip3 install matplotlib

# MPI for some examples, but not required to build for FPChecker
$ conda install openmpi=5.0.7 -c conda-forge
```

# Optional: Test your Clang installation

Create a file **hello.cpp** with this:

```
#include <iostream>

int main() {
    std::cout << "Hello, World!" << std::endl;
    return 0;
}
```

Compile and run:

```
$ clang --version

$ clang++ -o hello -O2 -g hello.cpp
$ ./hello
```

# Install FPChecker Dependencies with Conda (Option 2)

## *With environment file for Mac (ARM)*

```
# Create a conda env and dependencies
$ cd tutorial
$ conda create --name tutorial_env --file conda_environment.txt -c conda-forge
$ conda activate tutorial_env
```

- The `conda_environment.txt` file provides the packages for Mac (ARM 64-bit)
- This installs all the dependencies:
  - LLVM 19
  - Clang++ 19
  - Cmake

# Install FPChecker

```
$ mkdir build
$ cd build/
$ cmake -DCMAKE_INSTALL_PREFIX=../../install ..
$ make && make install

# Export installation path
$ export PATH=/tmp/tutorial/install/bin:$PATH
```

```
# If the right python3 is not found, set the DPython3_ROOT_DIR
$ cmake -DCMAKE_INSTALL_PREFIX=../../install -DPython3_ROOT_DIR=/opt/anaconda3 ..
```

# Tutorial Exercises

## Topics

## Example Program

- |   |                                               |                                                                          |
|---|-----------------------------------------------|--------------------------------------------------------------------------|
| 1 | NaN and Infinity exceptions                   | Linear system ( $Ax=b$ ) solver with LU decomposition + partial pivoting |
| 2 | Exponent usage – from FP64 and FP32 precision | Finite differences + 1D Reaction-Diffusion PDE                           |
| 3 | Controlling slowdown with code annotations    | Finite Elements + 2D Heat Conduction PDE solver                          |
| 4 | Analyzing parallel code: MPI/OpenMP           | MPI-based Parallel Heat PDE solver                                       |

# First, build the *common* library

## It will be used in all examples

- Common library:
  - BLAS operations
  - Linear solvers (LU, CG)
  - Matrix & vector printing
  - Other functionalities

```
# Compile library
$ cd /tmp/tutorial/FPChecker/tutorial/common/
$ FPC_INSTRUMENT=1 make
```

# Example 1:

## NaN & Infinity exception in linear solver

- Location:  
tutorial/example\_1/lu\_solve.cpp
- Program description
  - Linear solver  $Ax = b$
  - Solves  $Ax = 1$
  - LU decomposition:  $PA = LU$
  - Partial pivoting
  - Solve by forward/backward substitution

### FPChecker Use Case

- Use an ill-condition problem (matrix)
- Produces NaN and Infinity
  - U factor ends up with zero diagonal
  - Division by zero
- FPChecker locates the exceptions

# Example 1: Script (Good Matrix)

```
# Compile and run problem
$ FPC_INSTRUMENT=1 make
$ ./lu_solve matrix.csv

# List trace files (there is one)
$ ls -l .fpc_logs/

# Create report
$ fpc-create-report -t "./lu_solve matrix.csv"
$ open fpc-report/index.html

# Clear logs and remove report
$ fpc-create-report -rc
```

Nothing interesting in the report

# Example 1: Script (Bad Matrix)

```
# Run problem
$ ./lu_solve bad_matrix.csv

# Create report
$ fpc-create-report -t "./lu_solve bad_matrix.csv"
$ open fpc-report/index.html
```

- NaN
- Division by zero

# Report of Example 1

FPChecker

Report Title: `./lu_solve_bad_matrix.csv`

|  <u>Cancellation</u>          | 0                   |

# Report of Example 1

The screenshot shows a web browser window with the title 'FPChecker Report'. The address bar shows the file path: `/Users/lagunaperalt1/projects/fpchecker/FPChecker/tutorial/example_1/fpc-report/nan/nan.html`. The page features the FPChecker logo, which includes a magnifying glass over a checkmark. Below the logo, the report title is displayed as `./lu_solve_bad_matrix.csv`. A breadcrumb trail shows [Main Report](#) > [Nan](#). The main section is titled 'Nan Report' and contains a table with two columns: 'File' and 'Lines'. The table lists two files: `/Users/lagunaperalt1/projects/fpchecker/FPChecker/tutorial/common/blas.cpp` at line 4, and `/Users/lagunaperalt1/projects/fpchecker/FPChecker/tutorial/common/linear_solvers.cpp` at line 6. Below the table, the 'Inputs' section shows the command `./lu_solve_bad_matrix.csv`.

# Example 2:

## Exponent Usage on FP64-to-FP32 porting

- Location:

tutorial/example\_2/reaction\_diffusion.cpp

- Program description

- 1D linear **reaction-diffusion equation**
- *PDE*:  $\frac{\partial u}{\partial t} = D \frac{\partial^2 u}{\partial x^2} + \lambda u$
- Explicit finite difference method
  - Forward Euler in time, Central Difference in space
- Large  $\lambda$  provides positive feedback
  - Over time, it leads to **exponential growth**

- Code parameters:

$$D = 0.01$$

$$\lambda = 25$$

### FPChecker Use Case

- Run simulation in FP64 and FP32
- Vizualize exponent usage
- In FP32, values are "out-of-range"
  - Produce exceptions

# Example 2: Script

## FP64 Version

```
# Compile and run problem
$ FPC_INSTRUMENT=1 make
$ FPC_EXPONENT_USAGE=1 ./reaction_diffusion

# List trace files (there are two)
$ ls -l .fpc_logs/

# Create report
$ fpc-create-report
$ open fpc-report/index.html

# Clear logs and remove report
$ fpc-create-report -rc
```

# Report (Example 1, FP64)

## Exponent Usage Report

### FP64 Distribution

Out of range for  
FP32

### FP32 Distribution

# Example 2: Script

## First Step:

- Open `reaction_diffusion.cpp`
- Modify lines 7-8 to use FP32

```
typedef double Real_t;  
// typedef float Real_t;
```

## FP32 Version

```
# Compile and run problem  
$ FPC_INSTRUMENT=1 make  
$ FPC_EXPONENT_USAGE=1 ./reaction_diffusion  
  
# List traces files (there are two)  
$ ls -l .fpc_logs/  
  
# Create report  
$ fpc-create-report  
$ open fpc-report/index.html  
  
# Clear logs and remove report  
$ fpc-create-report -rc
```

# Report (Example 2, FP32)

|                                                                                                                  | Events                 |
|------------------------------------------------------------------------------------------------------------------|------------------------|
|  <u>Infinity (+)</u>            | <a href="#">15</a>     |
|  <u>Infinity (-)</u>            | <a href="#">3</a>      |
|  <u>NaN</u>                     | <a href="#">155658</a> |
|  <u>Division by zero</u>      | 0                      |
|  <u>Underflow (subnormal)</u> | 0                      |
|  <u>Comparison</u>            | 0                      |
|  <u>Cancellation</u>          | 0                      |

# Tutorial Examples

## Topics

- 1 NaN and Infinity exceptions
- 2 Exponent usage – from FP64 and FP32 precision
- 3 Controlling slowdown with code annotations
- 4 Analyzing parallel code: MPI/OpenMP

## Example Program

Linear system ( $Ax=b$ ) solver with LU decomposition + partial pivoting

Finite differences + 1D Reaction-Diffusion PDE

Finite Elements + 2D Heat Conduction PDE solver

MPI-based Parallel Heat PDE solver

# Example 3: Annotations to Control Slowdown

- Location:  
`tutorial/example_3/heat_PDE_finite_elements.cpp`
- Program description
  - **2D Heat conduction equation** with a source term
    - Steady state
  - *PDE*:  $\frac{\partial^2 T}{\partial x^2} + \frac{\partial^2 T}{\partial y^2} = s(x, y)$
  - Finite elements method
    - Triangular shapes
  - $T(x, y)$ : temperature distribution
  - Domain: L shape
  - Source  $s(x, y) = 0$
  - Boundary conditions: temp applied on the sides

## FPChecker Use Case

- Slowdown can be high (for a large problem)
- Reduce slowdown by annotating the code

# Example 3: Script

- Run small problem (10 nodes)
- Should take less than 1 second

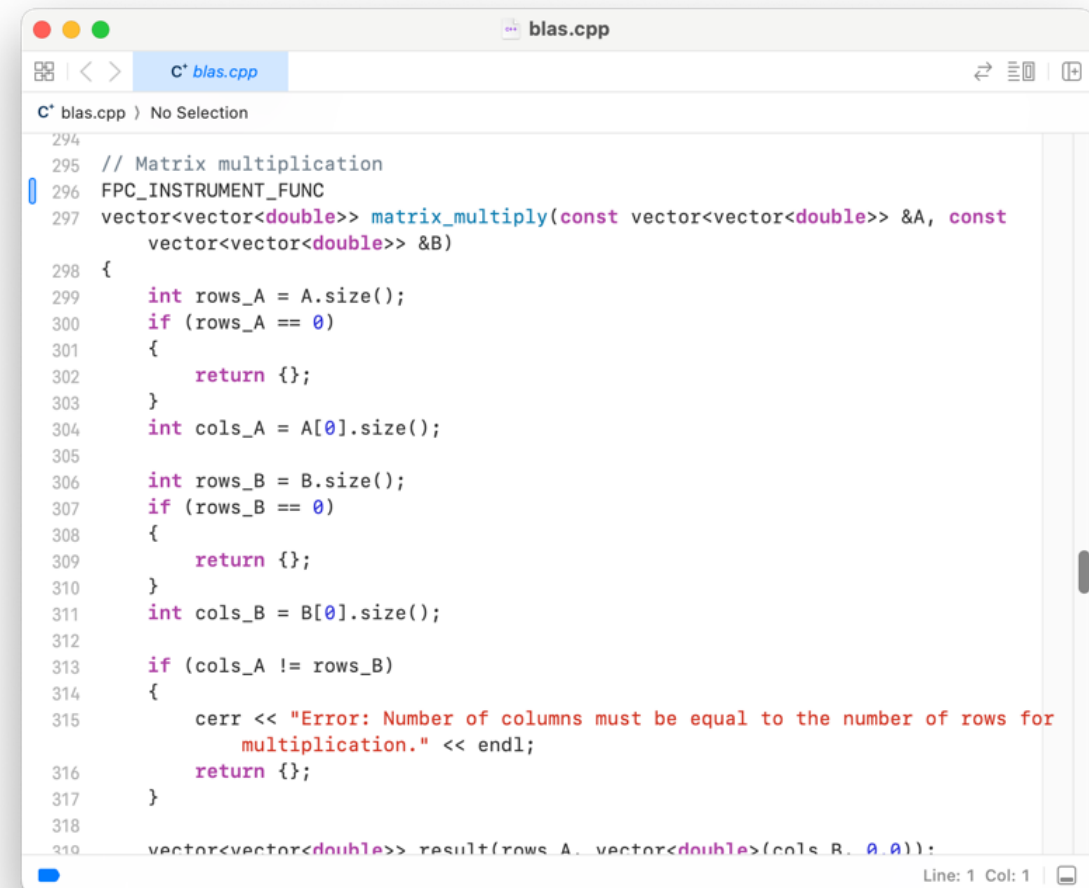

```
# Compile and run problem
$ FPC_INSTRUMENT=1 make
$ time FPC_EXPONENT_USAGE=1 ./heat_PDE_finite_elements 10
$
# Optional: Vizualize heat map
$ python3 plot.py
```

- Run a larger problem (50 nodes)
- It takes about 20 seconds in my laptop

```
# Compile and run problem
$ time FPC_EXPONENT_USAGE=1 ./heat_PDE_finite_elements 50
```

# Code Annotations

- Let's annotate the matrix-multiply function
  - That is: **we only instrument and analyze that function**
  - Should reduce overhead significantly
- Location:  
tutorial/common/blas.cpp
- Search for:  
`vector<vector<double>> matrix_multiply(...`
- Add (or uncomment):  
`FPC_INSTRUMENT_FUNC`

```
blas.cpp
C* blas.cpp
294
295 // Matrix multiplication
296 FPC_INSTRUMENT_FUNC
297 vector<vector<double>> matrix_multiply(const vector<vector<double>> &A, const
    vector<vector<double>> &B)
298 {
299     int rows_A = A.size();
300     if (rows_A == 0)
301     {
302         return {};
303     }
304     int cols_A = A[0].size();
305
306     int rows_B = B.size();
307     if (rows_B == 0)
308     {
309         return {};
310     }
311     int cols_B = B[0].size();
312
313     if (cols_A != rows_B)
314     {
315         cerr << "Error: Number of columns must be equal to the number of rows for
            multiplication." << endl;
316         return {};
317     }
318
319     vector<vector<double>> result(rows_A, vector<double>(cols_B, 0.0));
```

# Example 3: Script

Recompile the common library

```
$ cd ../common/  
$ make clean  
$ FPC_INSTRUMENT=1 FPC_ANNOTATED=1 make  
  
$ cd ../example_3/  
$ FPC_INSTRUMENT=1 FPC_ANNOTATED=1 make  
$ time FPC_EXPONENT_USAGE=1 ./heat_PDE_finite_elements 50  
...  
...  
real    0m1.049s  
user    0m0.729s  
sys     0m0.071s
```

Lower run time

# Tutorial Examples

## Topics

- 1 NaN and Infinity exceptions
- 2 Exponent usage – from FP64 and FP32 precision
- 3 Controlling slowdown with code annotations
- 4 Analyzing parallel code: MPI/OpenMP

## Example Program

Linear system ( $Ax=b$ ) solver with LU decomposition + partial pivoting

Finite differences + 1D Reaction-Diffusion PDE

Finite Elements + 2D Heat Conduction PDE solver

MPI-based Parallel Heat PDE solver

# Example 4: Analyzing MPI code

- Location:  
tutorial/example\_4/heat\_mpi.cpp
- Program description
  - 1D heat equation
  - $PDE: \frac{\partial u}{\partial t} = \alpha \frac{\partial^2 u}{\partial x^2}$
  - Explicit finite difference method
- MPI domain decomposition:
  - 1D spatial grid divided into NPROC contiguous segments
  - NPROC: number of MPI processes
  - Each process computes temperature in its segment

## FPChecker Use Case

- Generates traces for MPI programs
- Combine traces into a single report

# Example 4: Script

```
# Show Makefile uses CXX = mpic++-fpchecker
# Compile and run problem
# OMPI_CXX indicates to Open MPI which conda compiler to use
$ OMPI_CXX=clang++ FPC_INSTRUMENT=1 make
$ FPC_EXPONENT_USAGE=1 mpiexec -n 4 ./heat_mpi

# List trace files (there are 4)
$ ls .fpc_logs/
fpc_king01_95250.json fpc_king01_95251.json
fpc_king01_95252.json fpc_king01_95253.json

# Create report

# Summary

- FPChecker allows you to analysis floating-point applications:
  - Check for exceptions (Inf, NaN)
  - Location in the code
  - “Code smells”
  - Dynamic range analysis for FP32 and FP64
- Release **0.6** will have new functionality:
  - Report of Accumulated Rounding and Relative Error

Slides at: <https://fpanalysistools.org/SC25/>

# Preview of Next Release: **v0.6**

# Estimation of Rounding (& Relative) Error

Addition:

$$r^{32} = x^{32} + y^{32}$$

Original addition in float

---

$$x^{64} = \text{extend\_64}(x^{32})$$

Extend input to FP64

$$y^{64} = \text{extend\_64}(y^{32})$$

Extend input to FP64

$$r^{64} = x^{64} + y^{64}$$

Compute addition in FP64 with extended input

$$r_{original}^{64} = \text{extend\_64}(r^{32})$$

Extend original result to FP64

$$\text{error}^{64} = r^{64} - r_{original}^{64}$$

Report Title:

Events

Rounding Error

# Floating-Point is Nonintuitive & Tricky to Understand

- Representation error:

Mathematically:  $0.1 + 0.2 = 0.3$

In floating-point:  $0.30000000000000004$

- Comparing two numbers for equality is unreliable

Say we calculate  $a = 0.1 + 0.2$  and  $b = 0.3$

We would expect  $a == b$  to be true. But it's not!

# Floating-Point is Nonintuitive & Tricky to Understand (2)

- Loss of precision:

This could evaluate to 0.0:  $(10e8 + 1e-8) - 10e8$

- Cancellation:

Suppose:  $x=1.000000000000000001$ ,  $y=1.000000000000000002$

Mathematically  $y-x = 0.000000000000000001$

In floating-point:  $y-x = 2.220446049250313e-16$

**Large relative error!**

# The World is Going Low-Precision

- Architectures promote lower precision formats:
  - FP16, FP8
  - Bfloat16
  - TensorFloat-32
- We need tools to understand **mixed-precision** codes
- Important metrics to understand:
  - Dynamic range of FP32, FP16
  - Rounding error accumulation

# Showing the Configuration of the Installation

```
$ fpchecker-show
=====
          FPChecker Configuration
=====

Installation path: /tmp/tutorial/install

Add this to CFLAGS and/or CXXFLAGS:
-g -include /tmp/tutorial/install/src/Runtime_cpu.h -fpass-plugin=/tmp/tutorial/install/lib/libfpchecker_cpu.dylib

Wrappers are located here:
/tmp/tutorial/install/bin/clang-fpchecker
/tmp/tutorial/install/bin/clang++-fpchecker
/tmp/tutorial/install/bin/mpicc-fpchecker
/tmp/tutorial/install/bin/mpicxx-fpchecker
```

# Conda Commands:

- Removing an environment:  
`conda env remove --name <environment_name>`
- Adding an environment:  
`conda env --name <environment_name>`
- List environments:  
`conda env list`

# Demo FPChecker in Some Packages

| Package |                    | Build Model   |
|---------|--------------------|---------------|
| SuperLU | Linear solver      | C, cmake      |
| Hypre   | Linear solver      | C, cmake, MPI |
| LAMMPS  | Molecular dynamics | C, C++, cmake |
| FFTW    | Fourier transform  | C, autotools  |

# Example: SuperLU

```
$ git clone git@github.com:xiaoyeli/superlu.git
$ git clone https://github.com/xiaoyeli/superlu.git
$ cd superlu
$ git checkout 4ef39075e029927e8c959b22c8e7052dcb40c995
$ mkdir build
$ cd build
$ CC=clang-fpchecker cmake -DCMAKE_INSTALL_PREFIX=./install -Denable_internal_blaslib=ON ..
$ FPC_INSTRUMENT=1 make -j
make install
```

- Configure to build internal BLAS
  - There seems to be an error with fpchecker-clang and Cmake finding BLAS in Mac

# Example: FFTW

```
$ wget https://www.fftw.org/fftw-3.3.10.tar.gz
$ tar -zxvf fftw-3.3.10.tar.gz
$ cd fftw-3.3.10
$ CC=clang-fpchecker ./configure --disable-fortran --prefix=/tmp/tutorial/examples/fftw/fftw-3.3.10/fftw-install
$ FPC_INSTRUMENT=1 make -j
$ make install
```

- See example at:
  - FPChecker/tutorial/other\_examples/fftw:
    - fftw\_test.c

# Example: LAMMPS

```
$ wget https://github.com/lammps/lammps/archive/refs/tags/stable_29Aug2024_update2.tar.gz
$ tar -xvf stable_29Aug2024_update2.tar.gz
$ cd lammps-stable_29Aug2024_update2/
$ cd cmake/
$ mkdir build
$ cd build
$ CC=clang CXX=clang++ cmake \
  -DCMAKE_CXX_FLAGS="-include /tmp/tutorial/install/src/Runtime_cpu.h -fpass-
  plugin=/tmp/tutorial/install/lib/libfpchecker_cpu.dylib -g" \
  -DBUILD_MPI=OFF -DBUILD_OMP=OFF -DBUILD_FORTRAN=OFF \
  -DBUILD_SHARED_LIBS=OFF -DENABLE_TESTING=OFF ..
$ FPC_INSTRUMENT=1 make -j
$ ./lmp -in ../../examples/melt/in.melt
```

# Example: Hypre

```
$ git clone git@github.com:hypre-space/hypre.git
$ cd hypre
$ git checkout be52325a3ed8923fb93af348b1262ecfe44ab5d2
$ cd src
$ mkdir build
$ cd build
$ CC=clang cmake -DHYPRE_ENABLE_MPI=ON \
  -DHYPRE_WITH_EXTRA_CFLAGS="-include /tmp/tutorial/install/src/Runtime_cpu.h -fpass-
  plugin=/tmp/tutorial/install/lib/libfpchecker_cpu.dylib -g" ..
$ FPC_INSTRUMENT=1 make -j
$ make install
```

- HYPRE is installed in:
  - /tmp/tutorial/examples/hypre/src/hypre
- Test in tutorial/other\_examples/hypre:
  - To compile example:  
FPC\_INSTRUMENT=1 OMPI\_CC=clang make  
HYPRE\_MATRIX=matrix.csv ./hypre\_test 0
